

# Reducibility

problem A reduces to problem B

if A is reducible to problem B  
and B is decidable, then A is decidable

if A is reducible to B and A  
is not decidable, then B must  
be undecidable.

$$\text{HALT}_{\text{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM} \\ \text{and } M \text{ halts on} \\ \text{input } w \}$$

$\text{HALT}_{\text{TM}}$  is undecidable:  
proof (by contradiction)

Suppose  $\text{HALT}_{\text{TM}}$  is decidable  
and TM  $R$  decides it.

Construct  $S$  to decide  
 $A_{\text{TM}}$ .

$S =$  on input  $\langle M, w \rangle$

1. Run  $R$  on  $\langle M, w \rangle$
2. IF  $R$  rejects, reject
3. IF  $R$  accepts, simulate  $M$  on  $w$  until  $M$  halts.
4. IF  $M$  accepts, accept  
otherwise, reject

$$E_{TM} = \left\{ \langle m \rangle \mid M \text{ is a TM} \right. \\ \left. \text{and } L(M) = \emptyset \right\}$$

$E_{TM}$  is undecidable

Proof (by contradiction)

Suppose it isn't. So TM  $R$  decides  $E_{TM}$ .

given  $M, w$  create TM  $M'$

$M'$  = on input  $x$

1. if  $x \neq w$ , reject.

2. if  $x = w$ , run  $M$  on  $w$  and accept if  $M$  accepts.

$$L(M') = \begin{cases} \{w\} & \text{if } M \text{ accepts } w \\ \emptyset & \text{otherwise.} \end{cases}$$

$$L(M') \neq \emptyset \text{ iff } M \text{ accepts } w.$$

Construct  $S$  that decides  $A_{TM}$ .

$S$  = on input  $\langle M, w \rangle$

1. Use  $M, w$  to build  $M'$

2. Run  $R$  on  $M'$

3. if  $R$  accepts, reject.

if  $R$  rejects, accept.

$$EQ_{TM} = \left\{ \langle M_1, M_2 \rangle \mid \text{TM's } M_1 \text{ and } M_2 \text{ and } L(M_1) = L(M_2) \right\}$$

Reduction from  $E_{TM}$
